

Date: 03/03/15

An update to the EZ APS Toolbox has been released that includes several performance enhancements and bug fixes. The version of the new Toolbox is v4.14.

When setting the ID of a PBS in the Setup/Security page (while connected to a PBS via USB), the ID Selection dropdown now only allows the selection of valid IDs for the channel in which the PBS is connected instead of showing IDs for all channels. Also, if the Toolbox detects that the previously set ID does not match the channel that the PBS is connected to, a warning dialog will appear which informs the user to reset the PBS ID and the ID is automatically set to None.

Several additional changes have been made which address communication issues that may have appeared on rare occasions.

The new EZ APS Toolbox v4.14 is available on Polara's website in the main page of the Traffic section.
